

Ibrahim Haykal Alatas

Full Stack Developer

I build enterprise CRM and manufacturing systems with Laravel and React, turning messy operational data and legacy ERP constraints into workflows people actually trust.

BASED IN

Jakarta, Indonesia

Systems that hold up on the factory floor.

I'm a **Full Stack Developer** at PT Data Teknologi Terintegrasi, building **VALAK CRM**, an actuarial consulting platform on Laravel 12 and React 19. Before that I spent a year and a half inside **Astra Otoparts Group** digitalizing warehouses and maintenance workflows on top of a read-only Infor/Baan ERP: FIFO floor storage, rack visualization, Smart Andon, and a live Oracle-to-PostgreSQL migration with zero downtime.

Full Stack Developer

PT Data Teknologi Terintegrasi (Datapolis)

18 stages · 7 roles

625 FE + 116 BE commits

17 → 1 requests

930 → 205 ms

- Built a PSAK 219 actuarial report module in React and TypeScript, including multi-book projects and an automated final report release that replaced a manual process.
- Built an 18-stage project management board for 7 roles with realtime updates, now the firm's main workflow.
- Integrated the CRM with the actuarial valuation app through a backend relay covering data upload, calculation runs, and status tracking.
- Cut page requests: a 1,664-row company directory went from 17 chained requests to 1, and heavy sections now load on scroll.
- Wrote Laravel endpoints for leads, regional and team access control, and email preview, with API documentation.
- Built the account and security module on both sides for an app holding client payroll and employee benefit liabilities: email and password changes hashed server side, session cleanup on rejected tokens, and per-account data isolation on shared devices.
- Reduced server load through CORS preflight caching, column selection, and merging filter-option queries from 930 ms to 205 ms.

FEB 2025 - JUN 2026 · JAKARTA

Full Stack Developer Intern

PT Gemala Kempa Daya, Astra Otoparts Group

-76.10% search time

48 material blocks

400+ weekly transactions

30K+ rows in ~9s

- Developed a FIFO floor-storage warehouse monitoring system covering 48 material blocks and 400+ weekly transactions with QR gate in/out, digital block visualization, and supply scheduling, cutting material search cycle time by 76.10% (103.00 → 24.62 minutes, validated by time study).
- Built a finished-goods visualization system for Giant Rack Plant 3, mapping 80+ rack columns across multi-layer, top, and side U-shape layouts with customer filtering, barcode scanning, and shipment status tracking.
- Shipped inventory aging and LMB reporting for accounting reconciliation: 30K+ row multi-sheet Excel exports in around 9 seconds, with drill-down from warehouse summary to transaction detail.
- Designed Smart Andon maintenance monitoring with QR validation, lifecycle tracking, technician activity monitoring, and MTTR visibility.
- Built maintenance cost approval workflows spanning sparepart usage, COA classification, asset submission, and multi-level approval between Maintenance and Accounting.
- Executed a phased Oracle-to-PostgreSQL migration for the Trucking Control System using an application-level dual-write strategy, with zero downtime during live production.

AUG 2024 - JAN 2025 • JAKARTA

Web Developer

Nirmala Technology

- Built a QR-based restaurant ordering system with cart, checkout, order tracking, Midtrans payment webhook, and admin dashboard modules.
- Developed coliving and cafe event booking with room/event availability, deposit payments via Midtrans, payment status polling, webhook handling, email notifications, and a role-based admin CMS.
- Delivered a bilingual corporate profile platform on Laravel 11 and engineered responsive, component-based UI for the Q-Tin Dashboard using DaisyUI and Flowbite.

JUL 2023 - OCT 2023 • REMOTE

Junior Web Developer, Scholarship Participant

Digital Talent Scholarship, Ministry of Communication & IT

- Completed an intensive web development program focused on industry-standard engineering practices.
- Built a full-stack scholarship management platform with complete CRUD functionality using PHP and MySQL.

Database Administrator, BNSP National Professional Certification

VALAK CRM, Actuarial Consulting

React 19 · TypeScript · Laravel 12 · MySQL · Vite · React Query · Tailwind CSS

Internal CRM for an actuarial consulting firm that carries a PSAK 219 valuation from quotation to billing. I built the digital actuarial report module with multi-book projects and final report release, the 18-stage project board for 7 roles with realtime updates, and the bridge to the valuation app.

THE PROBLEM

One PSAK 219 employee-benefit valuation runs from quotation, employee data collection, and calculation in a separate valuation app, through draft report, sign-off, and printing, to billing. Seven roles touch it, and most of the flow was tracked by hand outside any system.

MY ROLE

Main frontend developer on the React app (625 commits), plus the Laravel endpoints those flows needed (116 commits), in a repo shared by several engineers. In daily use since the trial began in late September 2026.

KEY DECISIONS

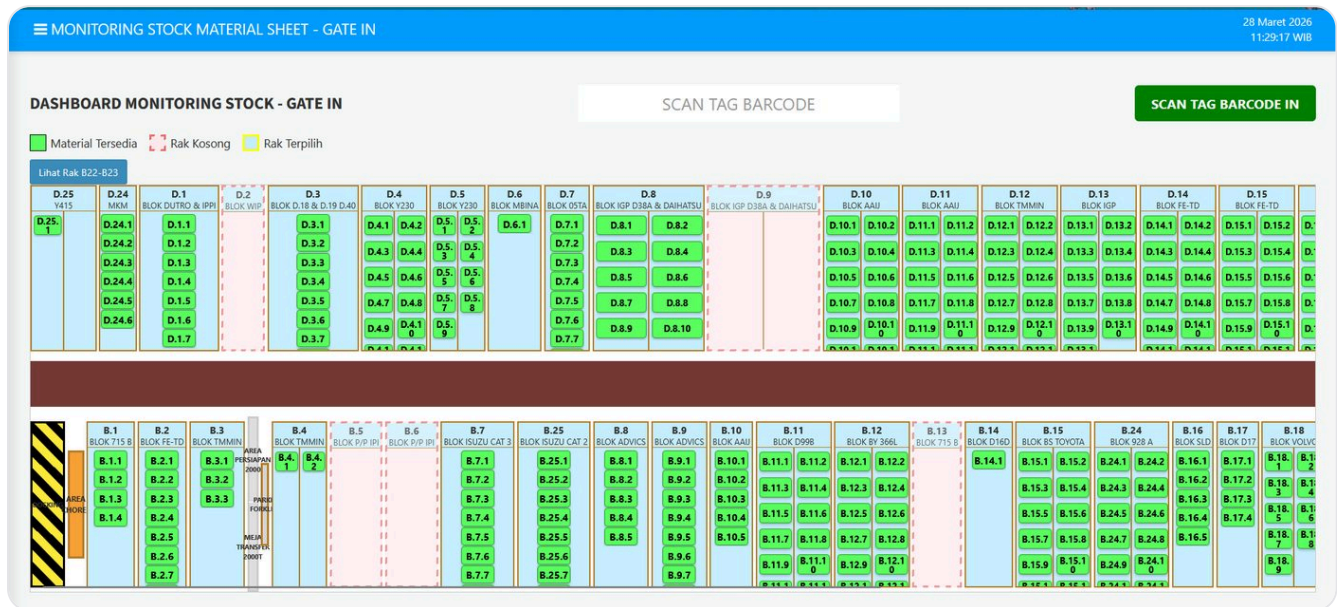

1. The prototype kept board stages in each browser's localStorage because the endpoint did not exist yet. Once the backend was ready I moved them to the database, so two people can no longer see different stages for the same project.
2. Moved access rules to the backend and had the frontend read flags from it, so nobody sees a button the server will reject. One account went from seeing 22 other people's tasks to 0.
3. Treated accounts and sessions as a requirement, since the app holds client payroll data: server-side hashed credentials, forced logout when a token is rejected, and per-account data cleared on logout.
4. Bridged the CRM to the valuation app through a backend relay: data is checked for anomalies, sent, calculated, and tracked without leaving the CRM.
5. Fixed what the trial exposed: 17 chained requests became 1, CORS preflight is cached for 24 hours, and filter options dropped from 930 ms to 205 ms.

RESULT

The firm's main daily workflow: an 18-stage board for 7 roles, digital PSAK 219 reports with multi-book support, and a final report release that replaced a manual process.

Real-Time Warehouse Inventory

Laravel · PostgreSQL · Oracle · JavaScript · PT Gemala Kempa Daya (Astra Otoparts Group)

FIFO floor-storage monitoring covering 48 material blocks and 400+ weekly transactions, with QR gate in/out, digital block visualization, and supply scheduling.

THE PROBLEM

Steel sheet material sat in 48 floor-storage blocks with 400+ transactions a week, tracked by hand on top of a read-only ERP. Finding one material took 103 minutes on average.

MY ROLE

Full stack developer intern at PT Gemala Kempa Daya. The system is also the subject of my published thesis.

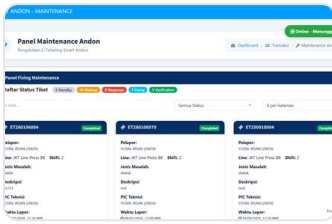

KEY DECISIONS

1. QR scanning at the gate, so every movement in or out is recorded the moment it happens instead of being typed in later.
2. A digital map of the blocks that mirrors the physical floor, so operators look a block up instead of walking the floor.
3. FIFO and supply scheduling enforced by the new system, since the Infor/Baan ERP was read-only and could not be changed.
4. Impact measured with a time study across 30 measurement cycles, not estimated.

RESULT

Material search time cut by 76.10%, from 103.00 to 24.62 minutes.

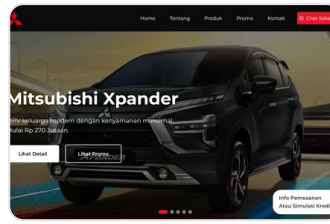

Other things I shipped.

Smart Andon Ticketing System

Digital ticketing for production issues: QR validation, lifecycle tracking, technician activity monitoring, and MTTR visibility.
